

Real Time Prescription Benefits

Expected Go Live Date	8/5/2020
Impacted Locations	All
Intended Audience	Ambulatory

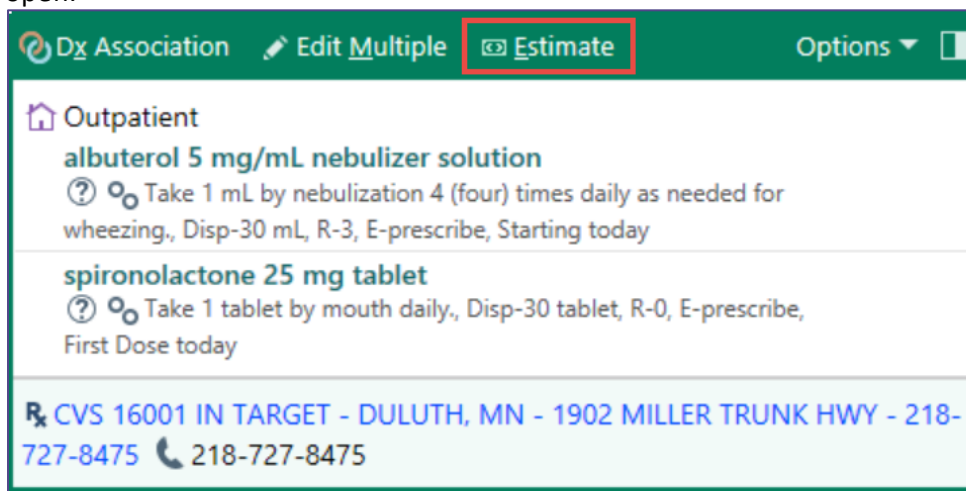

Real Time Prescriptions Benefits (RTPB) is a prescription benefit check solution that delivers access to critical financial information at the point of e-prescribing to help clinicians choose the best therapy for their patient. Click [here](#) to see a short demo of the functionality.

Rationale

- Clinicians can see patient-level out of pocket cost estimates for medications.
- Clinicians can see the cost of alternative medications, including mail order prices.
- Clinicians can quickly replace the current medication with an affordable alternative.

Medication Estimates

1. When prescribing medications, clinicians will now see an option for Estimate in the Order Composer. Selecting Estimate or signing the order will trigger the Patient Estimates window to open.

2. Patient Estimates will display a cost estimate of what the patient can expect to pay at their preferred pharmacy based on their payer formulary.
3. When there are alternative medications available, the system will display up to five other options. Clinicians can review the cost difference and replace the medication if appropriate.
4. Please note, if the clinician prefers that the Patient Estimates window does not populate upon signing the order, they are able to check the box for *Don't suggest alternatives while signing*.
